

Clear plans indicating escape routes, compartmentation & signage

Fire Strategy

Designing for fire can often be neglected within the design of new projects causing unnecessary expense or delays late in the day. We take a practical 'engineered approach' for fire strategy design to maximise building flexibility and minimise cost.

Our approach:

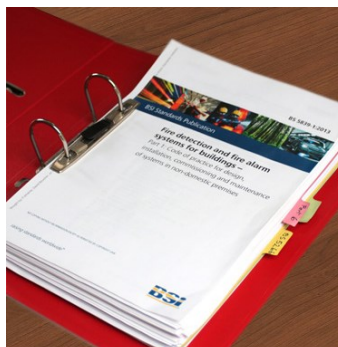

- Intelligent approach to fire strategy design in new and existing buildings.
- Compliant strategy designs to either Building Regulations Part B or BS 9999 whichever is more beneficial to the project.
- Compliance with building insurer's requirements.
- Assessment of existing buildings / roof spaces.
- Reducing the need for subdivision or cavity barriers within roof voids where adequate means of escape are provided.
- Advice in relation to fire and white wall panel composition.
- Leading the solution with approving bodies (Building Control / insurers).
- Fire strategies to American / international NFPA standards.
